

Lab 2 - Operating Systems

Kyle Courounis

September 10, 2023

1. The console in our project is similar to the Linux TTY in that we use a TypeScript file (represents the device file) that captures the keyboard events and then writes to the screen and a buffer. Also, in our terminal, the letters are drawn separately from what is being put into the buffer for execution, so they are not actually intertwined and really just mirror each other.
